

How to handle the request when a customer is unable to complete web check-in on the airline's website and contacts us regarding the issue.

- Check the booking status if it is open on GDS, for LCC on the airline website, and ask the customer to explain the specific problem they are facing.
- Ensure to check the specific timeframe for web check-in for the customer's flight to confirm that it is currently open. Each airline has its own designated window for web check-in, so make sure the customer is attempting to check in within this timeframe. Additionally, please verify and confirm that if web check-in is not available on the airline's website, the customer will need to complete the check-in process at the airport.
- If the web check-in window is open, please ensure that customer should use the correct information when performing web check-in, including their airline reference number, E-ticket number, and the exact name as listed in the booking.
- If the customer is still facing issues or is unable to complete web check-in, please advise the customer to contact the airline directly.
- If there are any issues with the booking itself that are preventing web check-in, attempt to resolve them. If contacting the airline is necessary to resolve the issue, place the booking on support after confirming with LOD.

How to handle customer requests for rebooking, cancellation, or adding ancillary when booking is in checked-in status.

- If the ticket status is checked-in, first try to cancel the web check-in on the airline website.
- If it is not possible to cancel web check-in on the website then refer the customer to the airline to uncheck the booking and then ask them to get in touch with us again for the request.
