

## Northstar Services Security Incident Response Procedure

Northstar Services - fictional stakeholder demonstration corpus

Employees must report suspected security incidents to the security hotline immediately and must not investigate alone.

The incident commander classifies severity, assigns owners, preserves evidence, and starts the response timeline.

Containment actions may include credential rotation, network isolation, access revocation, and temporary service restrictions.

For confirmed customer-data exposure, affected customers are notified without undue delay after facts are validated.

The response team completes a lessons-learned review within ten business days after incident closure.
